

iLife Integration Explained

New or upgraded machines include the iLife package from Apple. The package includes iTunes, iMovie, iPhoto and GarageBand. The integration of the separate pieces of software means that things you create, edit or manage with one are available to the other.

Example:

Create a piece of music in GarageBand and export it to iTunes. That piece of music is now part of your iTunes library. You can then run iPhoto to create a slideshow of pictures you have taken and you can select music from your iTunes library which includes the piece you have just created in GarageBand. Create an iMovie and you can select that same piece of music by clicking on the Audio tab and choosing your iTunes Library.
